Horelo

January 2020 - August 2021  
1 yrs 7 mos

. It is a start up with a forward-looking online inclusion solution on how to effect communities with an ecosystem that enables the people to trade within their community.

. Horelo is also published on google play store for public view and usage.

. Horelo ultimately is implement on react-native, postgres and GraphQL architecture. React-native is a tool that allows for development of solution for web, android OS and iOS platforms with one single source of truth.

. The solution requires scalability and flexibility for example to allow users define their roles, store items and records on the platform for a better experience with which in turn improved their lively hood.

Project at Horelo

- It is a react native forward-looking online inclusion solution on how to effect communities with an ecosystem that enables the people to trade within their community.

- It allows entrepreneurs to create and manage e-stores for their products.

- It allows entrepreneurs to manage access to store items and users on the stores.

- The platform allows for book keeping on how business is performing for a store.

- The platform allows a user to create an account as either an entrepreneur or client of a brand and as well as browsing as a guest.

- The solution encompasses scalability and flexibility for example to allow users define their roles, store items and records on the platform for a better experience with which in turn improved their lively hood.

There is a live react native copy on google play store.

The application is able to allow users to create accounts and manage all relevant details.

The application is able to allow users to create stores, assign co-users of the store and management.

The application is able to use google firebase for authentication of user accounts.

The application supports basic create, read, update and delete operations on all data fields according to authority.

The application supports reporting, search and filter on records of a store.

The application is able to create, read, update and delete shopping cart.

The project is three quarters through and yet operational for basic operations.

Tech used was built on react Native, node.js, android, css, firebase, graphql, javascript
